Human Immunology

Aims and Scope

Human Immunology offers an exchange of information and ideas centering on the immunological system of man. Pertinent information about the analogous systems of other vertebrates, including fish, birds, and mammals, may also be appropriate. The genes of the major histocompatibility complex and of T, B, and accessory cells and their products as regulatory molecules, disease markers, receptors, or targets are relevant topics. Subdisciplines such as neuroimmunology, immunopharmacology, and developmental and reproductive immunology are also considered insofar as they provide new insights. Limited space is available for reporting technological advances. Rapid publication of newsworthy items is provided by brief reports. Topics of general concern form the basis for editorials and seminar series.

Editor-in-Chief

Immunology Letters provides a vehicle for the rapid publication of concise research articles and minireviews in all aspects of immunology. The essential criteria for publication are clarity, experimental soundness and novelty. Results contradictory to current accepted thinking or ideas diverging from actual dogmas are considered for publication provided that they are based on solid experimental findings. Preference is given to papers of immediate importance to other investigators, either by their new methodology, experimental data or new ideas. Letters, commentaries and replies related to the published reports are also accepted provided that they are short (maximum 700 words) and scientifically relevant to the reports mentioned, in order to provide a continuing forum for discussion. Manuscripts may be submitted to the Editor-in-Chief or any of the other Executive Editors. Authors wishing to submit manuscripts should consult a recent copy of the journal or contact the publisher for instructions to authors.
